ELSBETT starts to release the kits for US pickups (2-tank)

After a lot of requests especially from the North American market we decided in Spring 2006 to downsize our well proofed Semi truck kit (300-550BHP) and offer the same technology for the most popular US-pickup trucks (150-300BHP). In December we fitted the first of these kits in a Ford Excursion (7,3-Powerstroke) and a GMC pickup(6,2 V8).

A group in California and in Wisconsin joined these workshops in December 2006 to convert their pickups. The kits got the same features like we are fitting since 6 years in our European Semi truck program. The most of the fuel related components are now integrated in our ELSBETT hybrid converter which let your car become a Flexible Fuel Vehicle.

Now we are ready for supply in the well known ELSBETT quality. The first kits for the Ford Powerstroke, GMC and Dodge engines are available now in our online shop:

Special thanks to the people who helped us on this way, like Doniga, Eric, Taavi, Luke, Jeff and David.

Kind regards

Alexander Noack
